SYSTEMS FOR ENHANCING COMMUNICATION OF CONTENT
OVER A NETWORK

Abstract of the Disclosure

Systems include components added to a node of a communication network for

5   providing a novel robot called RevBot which enables, for example, a website to

efficiently update information and content at other network nodes such as search engines.

These components are advantageously installed on the website's computer platform and

detect search engines and other qualifying databases and lists located at other nodes. The

RevBot can be used to filter, block and enhance website content. The RevBot can also be

10 used to facilitate E-commerce and data rights management (DRM) at the websites.
